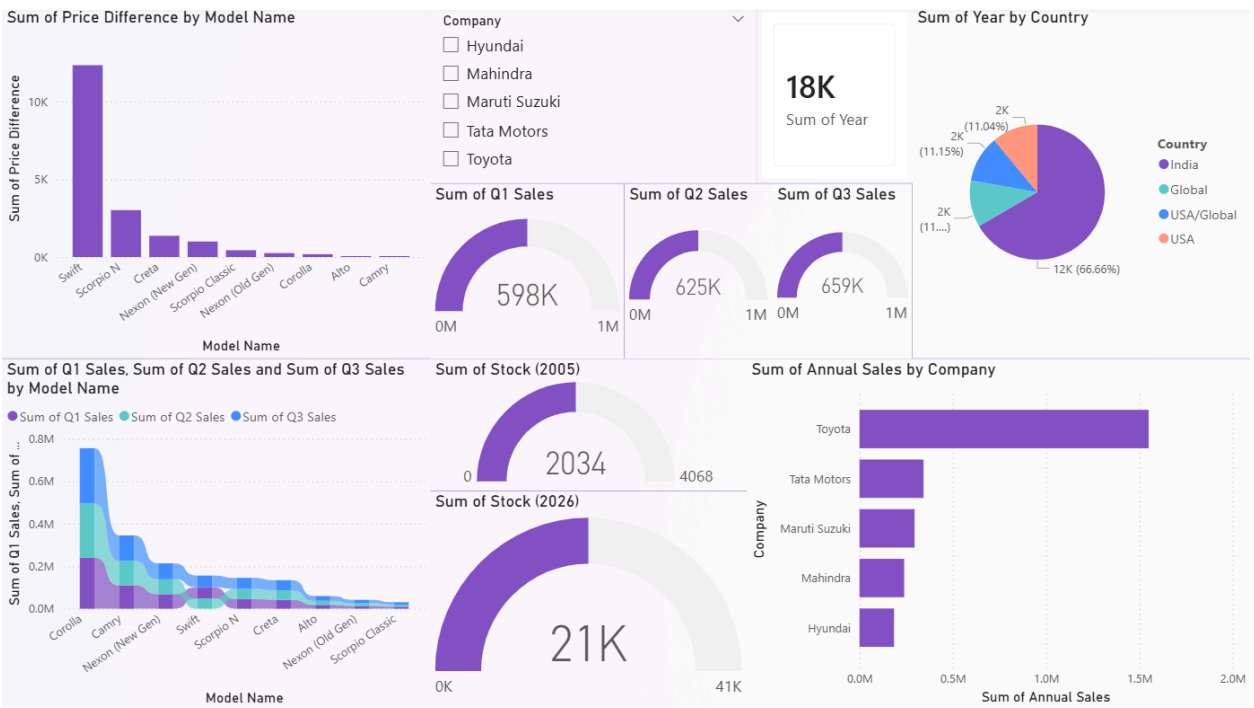
Dataset Overview & Objectives This project focuses on a cleaned automotive dataset spanning 2023 to 2026, featuring major players like Tata Motors, Mahindra, and Toyota. My primary goal was to analyze the relationship between vehicle sales performance and company stock valuation over time. I wanted to see if high-volume models, like the Toyota Corolla, correlate directly with stock price growth, or if market sentiment (Price Difference) is driven by newer, "New Gen" tech.

Key Visuals & Insights I developed a dashboard focusing on **Annual Sales vs. Stock Appreciation**. A standout insight is the massive "Price Difference" seen in Maruti Suzuki and Mahindra, suggesting that while Toyota leads in sheer volume (1.1M units), the Indian market is seeing explosive growth in stock valuation. The visualization of "Sales by Engine Code" also highlights a shift toward specific performance-oriented powertrains in the SUV segment.

	A	B	C	D	E	F
1	Visual Type	Fields to Use (From CSV)	Why?			
2	Clustered Column Chart	Axis: CompanyValues: Annual Sales	Shows who is moving the most metal.			
3	Line & Stacked Column	X-Axis: YearColumn: Q1-Q3 SalesLine: Stock (2026)	Shows if stock price follows sales trends.			
4	Scatter Plot	X: Co. ValuationY: Price Difference	Identifies which companies are "over-performing" the market.			



This is all about my project and have a look in the powerbi
